

Absolute agreement with extracellular measurements

Locked reserved evaluation · 47 contexts / 44 origins · 52 fixed targets

Dots: point estimates. Lines: marginal 95% origin-bootstrap intervals, conditional on fixed-panel estimability.

Absolute predicted differences $\leq 1e-5$ model units are ties. Invalid draws: 0/2000.

Pipeline and targets are fixed; no model-refitting or new-lineage uncertainty is represented.
