

Descriptive sensitivity, range separation and constancy

Locked reserved evaluation · 47 contexts / 44 origins · 52 fixed targets

A-B: changes across five fixed-rank magnitude transforms; no observed-outcome filter or accuracy interpretation.

C-D: primary setting. C uses observed-eligible pairs with range gaps > 1e-5; these are not confidence intervals.

D: 'Wide' means within-context range width > 1e-5; 'Constant' means between-context point span ≤ 1e-5.

'Zero' means all point magnitudes ≤ 1e-5. Model units apply. Small range width does not certify exact uniqueness.
